

ADVANCED SECURITY.

An add-on for your DMA managed WordPress hosting.

Every WordPress site on the internet receives automated attack traffic — login attempts, bots probing for vulnerabilities in plugins, and scripts targeting WordPress system files. Most of this happens in the background, invisible to the site owner, while the site continues to run normally.

44%

The Australian Cyber Security Centre reports that 44% of cyber incidents involving Australian small businesses affect a website or web application. For WordPress, the most common entry points are weak login credentials and unpatched plugins.

From early 2026, we increased our WordPress patching frequency — plugin and core updates — from monthly to weekly, in direct response to the significant rise in bot-driven attack traffic targeting sites across our network.

Our Advanced Security add-on addresses this at the network level. Rather than relying on WordPress plugins alone, we place a dedicated Cloudflare security firewall in front of your hosting environment. All traffic is inspected before it reaches your server.

All traffic is inspected before it reaches your server.

Malicious requests blocked before they reach your WordPress site.

WHAT'S INCLUDED

Protection applied at the network edge — before traffic reaches your site.

LOGIN PROTECTION Login is restricted to Australia and New Zealand. Attempts from all other countries are blocked at the network edge before they reach your WordPress login page. Additional countries can be configured for your specific website if required.	GLOBAL TRAFFIC CHALLENGE Traffic from Australia, New Zealand and the United States passes through freely, along with legitimate crawlers such as Google. All other traffic is challenged — real visitors clear it invisibly, bots do not — leaving your website faster for human visitors.
CONFIGURABLE RULES The login countries and the global traffic challenge are configurable. If your business works with clients or partners in a specific country, we can adjust your firewall rules to match.	SYSTEM FILE PROTECTION Automated scripts attempting to access WordPress configuration and system files are blocked globally.
RATE LIMITING Repeated login attempts from the same source are blocked, preventing brute-force attacks.	FORM PROTECTION Contact forms are protected with Cloudflare Turnstile, replacing Google reCAPTCHA and eliminating the billing attacks that occur when bots trigger reCAPTCHA checks at scale.
MONTHLY SECURITY REPORT A summary of what was blocked, where the traffic originated, and the current status of your protection.	

PRICING

AVAILABLE IMMEDIATELY

Available immediately as an add-on to your existing DMA hosting plan.

We handle the full setup and configuration. Advanced Security sits in front of your current environment — nothing about your existing plan changes.

If your DNS is not currently served via our Cloudflare system we will need to update your DNS hosting. Our team will guide you through this process.

SETUP · ONE-TIME

\$299

MONTHLY

\$89/month

ANNUAL · PAID YEARLY

\$979/year
